

To the Carson City Planning Commission

Subject: Request for Denial of SUP-19-013

I request the Carson City Planning Commission **DENY** SUP-19-013 for the following reasons.

The applicant and the Carson City Engineering Division have failed to address various issues related to adequate mitigation of noise, specifically barking of dogs that would be housed at the proposed dog boarding facility.

1. The applicant did not offer sufficient evidence of the sound attenuation properties of the vinyl fencing material proposed to suppress the sound of the dogs barking while outside. The subjective statement from the applicant stating in the application findings that the vinyl fence will resolve concerns of noise is absurd.
2. Carson City Development Engineering in reference to Carson City Municipal Code 18.02.080 (5b) – Use, Peaceful Enjoyment, Economic Value and Compatibility state they have no comment on this finding. How can noise pollution of this magnitude in close proximity to residences not be a factor to a person's peaceful enjoyment of where they live.
3. The plans and reports provided did not include adequate information as required in Carson City Municipal Code 18.02.080 (5h). The submittals and findings purported generalities with dealing with noise from barking dogs.
4. If Carson City does not have qualified engineers to make noise assessments, and is unable to produce noise mitigation recommendations based on data, I request that the applicant be required to contract with a acoustical engineering company to produce an environmental noise report with recommendations that will be implemented in the design of this facility. Past history with other special use permits have included noise analysis reports. I see no reason why this project should be exempt from a critical review of generated noise and recommendations to diminish its effects on neighbors.
5. The statement from the applicant affirm that while outside, dogs in the play yard will be limited in number to seven and always supervised. However the site drawing reveal that "luxury" kennels within the facility will have admittance to individual dog runs outside by means of an access door. These dog runs are not addressed in the supported findings. Are the total numbers of dogs allowed outside also include dogs in the dog runs? How will staff properly supervise a dog in a dog run to minimize barking? What hours will dogs have access to the dog runs? Lacks of detail on these issues are pathetic and support logistical questions on how this facility will be properly managed.
6. Within Recommended Conditions of Approval, item #22 states the applicant must submit plans that incorporate acoustic materials for review and approval by the Planning Division. I respectfully submit that only a qualified engineer in the field of acoustics can objectively review materials and its design for an effective outcome. If properly designed, sound attenuating baffles can reduce stress on dogs which is a major factor why many dogs bark at sound levels of 100db or more in a kennel environment. Item #29 is a primary factor in reducing noise transmission to adjacent properties. However the inferior technology of exterior sound blankets has now been replaced with heavy mineral filled visco elastic materials that can effectually reduce transmitted noise by up to eighty-five percent. These new products are permanently mounted and weather resistant. Acoustifence made by Acoustiblok is one such product. If properly installed at the perimeter of the facility at a height designed by an expert, the impact on neighbors of barking of dogs can be drastically minimized.

Respectfully,

To the Carson City Planning Commission

Subject: Request for Denial of SUP-19-013

I request the Carson City Planning Commission **DENY** SUP-19-013 for the following reasons.

The applicant and the Carson City Engineering Division have failed to address various issues related to adequate mitigation of noise, specifically barking of dogs that would be housed at the proposed dog boarding facility.

1. The applicant did not offer sufficient evidence of the sound attenuation properties of the vinyl fencing material proposed to suppress the sound of the dogs barking while outside. The subjective statement from the applicant stating in the application findings that the vinyl fence will resolve concerns of noise is absurd.
2. Carson City Development Engineering in reference to Carson City Municipal Code 18.02.080 (5b) – Use, Peaceful Enjoyment, Economic Value and Compatibility state they have no comment on this finding. How can noise pollution of this magnitude in close proximity to residences not be a factor to a person's peaceful enjoyment of where they live.
3. The plans and reports provided did not include adequate information as required in Carson City Municipal Code 18.02.080 (5h). The submittals and findings purported generalities with dealing with noise from barking dogs.
4. If Carson City does not have qualified engineers to make noise assessments, and is unable to produce noise mitigation recommendations based on data, I request that the applicant be required to contract with a acoustical engineering company to produce an environmental noise report with recommendations that will be implemented in the design of this facility. Past history with other special use permits have included noise analysis reports. I see no reason why this project should be exempt from a critical review of generated noise and recommendations to diminish its effects on neighbors.
5. The statement from the applicant affirm that while outside, dogs in the play yard will be limited in number to seven and always supervised. However the site drawing reveal that "luxury" kennels within the facility will have admittance to individual dog runs outside by means of an access door. These dog runs are not addressed in the supported findings. Are the total numbers of dogs allowed outside also include dogs in the dog runs? How will staff properly supervise a dog in a dog run to minimize barking? What hours will dogs have access to the dog runs? Lacks of detail on these issues are pathetic and support logistical questions on how this facility will be properly managed.
6. Within Recommended Conditions of Approval, item #22 states the applicant must submit plans that incorporate acoustic materials for review and approval by the Planning Division. I respectfully submit that only a qualified engineer in the field of acoustics can objectively review materials and its design for an effective outcome. If properly designed, sound attenuating baffles can reduce stress on dogs which is a major factor why many dogs bark at sound levels of 100db or more in a kennel environment. Item #29 is a primary factor in reducing noise transmission to adjacent properties. However the inferior technology of exterior sound blankets has now been replaced with heavy mineral filled visco elastic materials that can effectually reduce transmitted noise by up to eighty-five percent. These new products are permanently mounted and weather resistant. Acoustifence made by Acoustiblok is one such product. If properly installed at the perimeter of the facility at a height designed by an expert, the impact on neighbors of barking of dogs can be drastically minimized.

Respectfully,

However the inferior technology of exterior sound blankets has now been replaced with heavy mineral filled visco elastic materials that can effectually reduce transmitted noise by up to eighty-five percent. These new products are permanently mounted and weather resistant. Acoustifence made by Acoustiblok is one such product. If properly installed at the perimeter of the facility at a height designed by an expert, the impact on neighbors of barking of dogs can be drastically minimized.

Respectfully,

Ana Valenzuela

To the Carson City Planning Commission

Subject: Request for Denial of SUP-19-013

I request the Carson City Planning Commission **DENY** SUP-19-013 for the following reasons.

The applicant and the Carson City Engineering Division have failed to address various issues related to adequate mitigation of noise, specifically barking of dogs that would be housed at the proposed dog boarding facility.

1. The applicant did not offer sufficient evidence of the sound attenuation properties of the vinyl fencing material proposed to suppress the sound of the dogs barking while outside. The subjective statement from the applicant stating in the application findings that the vinyl fence will resolve concerns of noise is absurd.
2. Carson City Development Engineering in reference to Carson City Municipal Code 18.02.080 (5b) – Use, Peaceful Enjoyment, Economic Value and Compatibility state they have no comment on this finding. How can noise pollution of this magnitude in close proximity to residences not be a factor to a person's peaceful enjoyment of where they live.
3. The plans and reports provided did not include adequate information as required in Carson City Municipal Code 18.02.080 (5h). The submittals and findings purported generalities with dealing with noise from barking dogs.
4. If Carson City does not have qualified engineers to make noise assessments, and is unable to produce noise mitigation recommendations based on data, I request that the applicant be required to contract with a acoustical engineering company to produce an environmental noise report with recommendations that will be implemented in the design of this facility. Past history with other special use permits have included noise analysis reports. I see no reason why this project should be exempt from a critical review of generated noise and recommendations to diminish its effects on neighbors.
5. The statement from the applicant affirm that while outside, dogs in the play yard will be limited in number to seven and always supervised. However the site drawing reveal that "luxury" kennels within the facility will have admittance to individual dog runs outside by means of an access door. These dog runs are not addressed in the supported findings. Are the total numbers of dogs allowed outside also include dogs in the dog runs? How will staff properly supervise a dog in a dog run to minimize barking? What hours will dogs have access to the dog runs? Lacks of detail on these issues are pathetic and support logistical questions on how this facility will be properly managed.
6. Within Recommended Conditions of Approval, item #22 states the applicant must submit plans that incorporate acoustic materials for review and approval by the Planning Division. I respectfully submit that only a qualified engineer in the field of acoustics can objectively review materials and its design for an effective outcome. If properly designed, sound attenuating baffles can reduce stress on dogs which is a major factor why many dogs bark at sound levels of 100db or more in a kennel environment. Item #29 is a primary factor in reducing noise transmission to adjacent properties. However the inferior technology of exterior sound blankets has now been replaced with heavy mineral filled visco elastic materials that can effectually reduce transmitted noise by up to eighty-five percent. These new products are permanently mounted and weather resistant. Acoustifence made by Acoustiblok is one such product. If properly installed at the perimeter of the facility at a height designed by an expert, the impact on neighbors of barking of dogs can be drastically minimized.
