Subj: Replacement louvers for the steeple at the BAC

Proposed are dimensional replicas of the louvers for the steeple. These dimensional replicas would look like functioning louvers. The dimensional replicas would look like what was previously on the steeple and placed onto the steeple on the outside. With careful consideration to the design that is previously on the church of all the moldings and trim these dimensional replicas could be constructed all at one time and then placed upon the four sides of the steeple in a single operation. Construction of the dimensional replicas could take place offsite of the BAC and could be made from more modern materials that would not suffer the same type of rot and disrepair as the previous ones assuring that the steeple would look as it did for future generations to come. The dimensional replicas would also not allow for pests like birds and bats to enter the steeple reducing the likelihood of an infestation. The construction of the dimensional replicas and applying them to the outside would reduce the cost and the construction, time while maintaining the integrity of the design.
